PRESS RELEASE

Renewable Energy Systems: Battery Selection Support

With the increased interest in batteries for stand-alone renewable energy systems, both photovoltaic and small wind, Industrial Batteries (UK) Limited – IBLUK – has enhanced its customer support for these applications.

The website now contains a dedicated page for renewable energy systems with downloads giving an overview of the factors which need to be taken into account when choosing a battery for such an application. In particular, with an increasing number of systems being installed in critical applications such as telecommunications and navigational aids, system integrity and availability are paramount, and safe and reliable solutions are required. Clearly, for optimum reliability the battery chosen for the system must match the characteristics of the other components in the system.

IBLUK offer the Alcad Solar battery range which are purpose built to operate in photovoltaic and other renewable energy applications. The range is specifically designed to work over the wide temperature range and unpredictable duty cycle found in these applications. With a high level of reliability and very low maintenance, a low life-cycle cost can be achieved. IBLUK offer a renewable energy battery sizing service to ensure that the correct battery is chosen to comply with the application requirements.

In addition to supplying the battery, IBLUK are able to specify battery stands and accessories to suit the customer's requirements, to provide a complete battery package.

IBLUK are a UK company specialising in industrial nickel-cadmium batteries and support. In addition to assisting the customer in his choice of battery and battery stand, it can also offer an extensive selection of approved accessories, a technical consultancy service, user training and a battery replacement and recycling service
